DUCTILE IRON
Pipes & Fittings
KEJRIWAL

We are committed to produce
quality Products
**(C.I., D.I., C.S. Valves, Pipes, Fittings,
Manhole Covers, Surface box etc.)**
consistently on schedule to the best
satisfaction of all our customers.

We shall also strive for improvement in
Quality Management System
by establishing and achieving
Quality Objectives
aimed at overall improvement
in our activities for enhanced
customer satisfaction.

Kejriwal CASTINGS LIMITED

Manufacturers of
Ductile Iron & Cast Iron Pipes, Fittings, Valves Etc

Eleventh Edition
2025-26

Late Bhagawati Prasad Kejriwal

Founder

In 1956, just nine years after India gained independence, the nation was grappling with the aftermath of partition. Amidst this challenging backdrop, a young enthusiast from Rajasthan, driven by a zeal to make a difference and an eye for opportunities, took a bold step. He ventured into setting up a cast iron foundry in Howrah, West Bengal. This marked the beginning of the remarkable journey of our founder, a visionary, the late **Shri Bhagwati Prasad Kejriwal.**

Hailing from the small town of Ramgarh in Rajasthan, Shri Kejriwal had limited formal education. However, he more than compensated for this with his hard work, sincerity, dedication, and acute business sense. His passion and integrity were the cornerstones of his success. As Shri Kejriwal wisely said, "In the realms of business and industry, it is vision and perseverance that pave the way to success."

The journey that began with a modest foundry in 1956 has undergone numerous transformations over nearly seven decades. Today, Kejriwal Castings Ltd stands as a testament to sheer willpower and endurance. Under the visionary leadership of Shri Bhagwati Prasad Kejriwal, the company thrived on a foundation of quality, ethical practices, and forward-thinking approaches.

A true pioneer, Shri Kejriwal's passion for pushing boundaries and embracing new challenges was the hallmark of our growth. From the early days, he recognized the importance of staying ahead of technological advancements and integrating them into our processes. His relentless pursuit of excellence and deep understanding of market dynamics enabled the company to evolve and flourish in an ever-changing landscape, achieving numerous firsts in the field.

As the Rig Veda wisely notes, **"When there is harmony between the mind, heart, and resolution, then nothing is impossible."**

Applications/Limitations

1. This Certificate does not exempt the purchaser from his responsibility to ensure that the qualification is valid for the products within the requirements of the EN 545:2010 & BIS 2531:2009/Cor 1:2010.
2. Supply of the products as listed above shall be as per inspection documentation EN 10204 type- 3.1 or 3.2 requirements under the discretion of the Purchaser.
3. The re-qualification process shall be repeated if any essential changes are made to the production route or the manufacturing procedure, E.g. change in the final melting/holding process, a major change of the casting method, a major change of manufacturing equipment, welding procedure & process etc.
4. If production is carried out at different plants/locations, a separate qualification is required for each plant. This applies also for change of in-house to subcontractors or change of subcontractor for essential operations.
5. Welding, where permitted by relevant standard shall be carried out by qualified welders according to qualified procedures.
6. NDT operator qualification shall be as per ISO EN ISO 9712/equivalent, based on the purchaser's requirements.

Terms and conditions

The Certificate is subject to the following terms and conditions:

- Product Liability rests with manufacturer, in case of damages caused by defective products.
- It is only valid for the product(s) listed above.
- A visit shall be made to the manufacturers in case of changes to essential processes, or during re-qualification. Manufacturer shall inform the local DNV office for any changes made with respect to any design changes or Manufacturing processes.

The following may render this Statement invalid:

- Any deviation to application/limitation listed above.
- Changes or amendments to the referenced standard and Technical File

Ductile Iron Pipes

Ductile Iron (DI) Pipes

Ductile Iron (DI) Pipe's good mechanical properties, in addition to high durability, strength and corrosion resistance properties make them ideal for high-pressure applications. Ductile Iron pipes are used extensively in systems transporting potable water, industrial water, irrigation water and waste water. Metallic pipes, primarily Cast Iron had been used over two centuries for water and wastewater transportation. Ductile Iron pipes which belong to the family of Cast Iron have been developed by treating the molten low-sulphur and low-phosphorous base iron with magnesium under closely controlled conditions. The startling change in the metal is characterized by the free graphite in Ductile Iron being deposited in the spheroidal or nodular form, leading to maximum continuity of metal matrix thereby forming a stronger and tougher ductile material with high ductility and tensile strength.

With protective linings and coatings like cement mortar, bitumen, epoxy, zinc and polyurethane, Ductile Iron pipes provide an exceptionally long life to serve the water and sanitation networks.

The flexible and leak tight jointing systems in Ductile Iron pipes, which can be easily push fitted (or mechanically joined) provides ease in transportation of pipes as well as laying works. The pipeline and jointing system can withstand the vagaries of nature, thereby ensuring sustainable and quality piping solutions to the customers.

The capacity of Kejriwal Castings Limited is as follows

- Ductile Iron Pipe manufacturing facility (installed capacity 100,000 MT per annum)
- Ductile Iron Castings manufacturing facility (installed capacity 12,000 MT per annum)

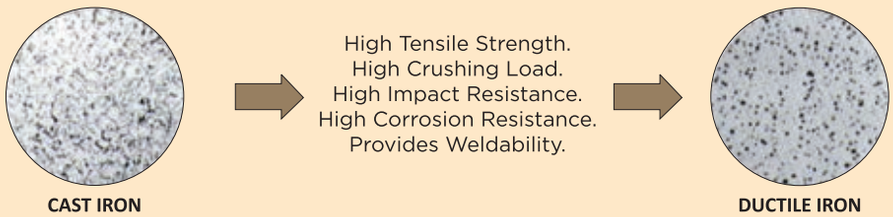
Quality is the key mantra at Kejriwal Castings Limited. Quality checks are carried out at every stage of the manufacturing process to meet the requirements as per international standards.

'Nurture with Nature' is the guiding principle for Kejriwal. To ensure eco-friendly and sustainable growth, all the plants of Kejriwal are equipped with advanced pollution control units and ecology conservation systems. Ductile Iron pipes manufactured by the company conform to both Indian and International Standards like IS 8329, ISO 2531, ISO 7186, BSEN 545 and BSEN 598.

Mechanical Properties of Ductile Iron Pipes

Ductile Iron

Ductile Iron is produced by treating the molten low-Sulphur and low-Phosphorous base Iron with Magnesium under closely controlled conditions. The metal characteristics are enhanced by the free graphite in Ductile Iron being deposited in the spheroidal form or nodular form instead of flaky form as in grey Iron. Due to the presence of free graphite in the nodular form, the continuity of metal matrix is at the maximum, leading to the formation of a stronger, tougher ductile material exceeding grey (or cast) Iron in strength, in ductility and in tensile strength.



Microstructure transformation of Cast Iron to Ductile Iron

Mechanical Properties of Ductile Iron pipes

Mechanical Properties	Values
Tensile Strength	Min. 4,200 kg/cm² or 420 MPa
Yield Strength	3,000 kg/cm² or 300 MPa
Minimum Elongation	For Pipe - 10% up to DN 1000. For Fittings 5%
Modulus of Elasticity	1.62×10^6 - 1.70×10^6 kg/cm² or 162,000 - 170,000 MPa
Hardness	< 230 BHN
Density	7,050 kg/m³
Bending/Beam Strength	More than 500 MPa or 5098 kg/cm²
Co-efficient or Thermal	11.5×10^{-6} per Degree Celsius
Expansion	(for temperature range 20-100°C)
Thermal Conductivity	36 Wiper Degree Celsius m-k (for temperature range 20-100°C)
Specific Heat	460 J/Kg-K for temperature range 20 - 100°C
Electrical Resistivity	2.24×10^{-5} - 3.56×10^{-5} Ohm/cm (for temperature range 20 - 300°C)
Compressive Strength	550 MPa (minimum)
Torsional Strength	3,800 kg/cm² or 380 MPa
Poisson's Ratio	0.275

Technical Specifications

Product Name	Ductile Iron pipe suitable for Push-on-Joint, Flanged Joint, Restrained Joint as per ISO 2531; BSEN 545; BSEN 598; ISO 7186; IS 8329; ISO 10804
Class of Pipe	C20, C25, C30, C40, C50, C64, C100, Class K7, Class K9 and PP Class
Size Range	DN 80 mm to DN 400 mm
Standard Length	5.5 / 6.0 meter
Internal Lining	• Cement Mortar Lining as per IS 8329/ISO 4179 • Cement Mortar Lining with Bituminous Seal Coat as per IS 8329 / ISO 16132 • Cement Mortar Lining with Epoxy Seal Coat as per IS 8329 / ISO 16132 • Polyurethane Lining as per BSEN 15655 • Cement Type: Ordinary Portland Cement/Sulphate Resistant Cement/ Blast Furnace Slag Cement / High Alumina Cement • Liquid Epoxy Paint as per EN 14901 • Fusion Bonded Epoxy as per EN 14901 • Ceramic Epoxy Lining
Outside Coating	• Zinc Coating (130 gm/m² or 200 gm/m² or 400 gm/m²) with finishing layer of Bitumen / Blue Epoxy / Red Epoxy / Aluminum pigmented Bitumen as per IS 8329 / ISO 8179. • Alloy of Zinc and Alluminium with or without metals having a minimum mass of 400 gm/m² with finishing layer of Bitumen/Blue Epoxy/Red Epoxy as per IS 8329 / ISO 8179. • Polyurethane Coating as per IS 8329 / BSEN 15189.
Outside On-site Protection	• Polyethylene Sleeving as per IS 8329 / ISO 8180
Coating of Joint Area	• Bitumen as per BS 3416 • Epoxy - Blue/ Red as per BSEN 14901 • Polyurethane as per BSEN 15189

2400	2495		21.4	25.8								
2600	2702		23.1	27.9								

NOTE:
- The tolerance on pipe wall thickness is - (1.3+0.001 DN) for thickness greater than 6.0 mm and -1.3 mm for thickness less than or equal to 6.0 mm
- For centrifugally cast pipes, minimum wall thickness shall not be less than 3.0 mm

Allowable Pressure

Classification of Ductile Iron Pipes from Thickness (K) Class to Pressure (C) Class

Prior to revision of International Standards in the year 1998, Ductile Iron pipes were classified based on the thickness, i.e K7, K8, K9 etc (also known as Thickness Class). The allowable pressures were calculated based on the nominal wall thickness of the pipe. As per ISO 2531:1998, the minimum thickness in the standards was K9. In event of lower operating pressure in the system users had no choice than to select the K9 class of pipe with higher value of allowable operating pressures. On the other hand, other pipe materials such as for Steel pipes, the pipe's wall thickness were designed on the basis of operating pressure in the system with the assumption of certain safety factors. In view of the above so as to bring parity in classification of Ductile Iron pipes, amendment to ISO 2531:1998 were done to introduce 'C' class pipes in the revised edition of ISO 2531:2009. EN 545:2002 edition introduced class C 40 pipes along with K9 class pipes. Finally in the subsequent revision of EN 545:2010 the pressure class was introduced completely abolishing the Thickness based classification.

In line with the introduction of 'C' class pipes, the Design Standard for Ductile Iron pipes, i.e. ISO 10803:2011 was revised accordingly.

PFA: Allowable Operating Pressure: Maximum hydrostatic pressure that a component is capable of withstanding continuously in service. For 'C' class pipes, the number followed by letter 'C' indicates the PFA. For example C 20 means the pipe has maximum allowable pressure of 20 bar or 20 Kg./cm^2. For 'C' class, the values are given in Table 9.

PMA: Allowable Maximum Operating Pressure: Maximum pressure occurring from time to time, including surge, that a component is capable of withstanding in service. PMA = 1.2x PFA; the values are given in Table 9.

PEA: Allowable Test Pressure: Maximum hydrostatic pressure that a newly installed pipe/component is capable of withstanding for a relatively short duration, in order to ensure the integrity and tightness of the pipeline.

PEA =1.2x PFA + 5 bar; the values are given below

'C' Class Pipe - As per ISO 2531 & BSEN 545

Pressure Class	Allowable Operating Pressure, PFA	Maximum Allowable Operating Pressure, PMA	Allowable SiteTest Pressure , PEA
C	Bar	Bar	Bar
20	20	24	29

Hydrostatic Work Test Pressure

Hydrostatic Work Test Pressure for Pipes and Fittings

Hydrostatic tests are done at works to check the leak-tightness of pipes. The tests are carried out before application of external coating and internal lining.

a) 'K' Class Ductile Iron Pipes

Hydrostatic Test Pressure at Works for 'K' Class Ductile Iron pipes

Nominal Diameter	Minimum Hydrostatic Test Pressure at Works, MPa					
	Centrifugally Cast Pipes with Flexible Joints		Pipes with Welded-on-Flange			
	K7	K9	PN 10	PN 16	PN 25	PN 40
DN 80 - DN 300	3.2	5.0	1.6	2.5	3.2	4.0
DN 350 - DN 400	2.5	4.0	1.6	2.5	3.2	4.0
450 - 600	2.5	4.0	1.6	2.5	3.2	4.0
700 - 1000	1.8	3.2	1.6	2.5	3.2	--
1100 - 2000	1.2	2.5	1.6	2.5	2.5	–

b) 'C' Class Ductile Pipes

The internal hydrostatic test pressure should be raised until it reaches the works hydrostatic test pressure, equal to the pressure class and limited to the pressure of preferred class. Higher pressures are permissible. The total duration of the pressure cycle shall not be less than 15 seconds including 10 second at test pressure.

c) Ductile Iron Fittings

Hydrostatic Test Pressure at Works for Ductile Iron fittings

Nominal Diameter (DN)	Pipes not centrifugally Cast, Fittings and Accessories (Bar)
80 - 300	25
350 - 600	16
700 - 1400	10
1500-2000	10

Standard Lining

Internal Lining of Cement Mortar

The internal cement mortar lining of Ductile Iron pipes constitute a dense, homo-geneous layer covering the total internal surface of the pipe barrel. The cement mortar mix shall comprise cement, sand and water. The cement should be one of those listed below:

- All kinds of Portland cement
- Blast Furnace Slag cement
- Sulphate Resistant cement and
- High Alumina cement

The water used in the mortar mix complies with standard set for drinking water.

Internal Cement Mortar Lining

Strength of Lining

When measured, the compressive strength of the cement mortar after 28 days of curing shall not be less than 50 MPa. The compressive strength of the lining is directly related to other functional properties such as high density, good bond and low porosity.

Thickness and Surface Condition

The surface of the cement mortar lining should be uniform and smooth. Trowel marks, protrusion of sand grains and surface texture inherent to the method of manufacture are acceptable. However, there should be no recesses or local defects which reduce the thickness to below the minimum value. The nominal thickness of the cement mortar lining and its tolerance should be as given in table below

Thickness of Cement Mortar Lining

As per BS EN 545

DN	Thickness mm	
	Nominal Value	Limit Deviation
40 - 300	4	-1.5
350 - 600	5	-2.0
700 - 1200	6	-2.5
1300 - 1400	9	-3.0
1500 - 2000	9	-3.0
2200 - 2600	12	-5.0

As per ISO 2531

DN	Thickness mm	
	Nominal Value	Limit Deviation
40 - 300	3	2
350 - 600	5	3
700 - 1200	6	3.5
1400 - 2000	9	6
2200 - 2600	12	7

As per IS 9523

DN	Thickness mm		Max Crack width & Radial Displacement
	Nominal Value	Tolerance	
80 - 300	3	-1.5	0.8
350 - 600	5.0	-2.0	1.0
700 - 1200	6.0	-2.5	1.2
1400 - 2000	9.0	-3.0	1.5

Note : Higher thickness can also be provided as per customer requirement.

Standard Coating

All pipes are supplied with an external coating of metallic Zinc or Zinc-Aluminium Alloy (Zn-Al Alloy) with a finishing layer of Bitumen/Epoxy Resin. Aluminium Pigmented Bitumen.

External Coating of Zinc with Finishing Layer of Bitumen

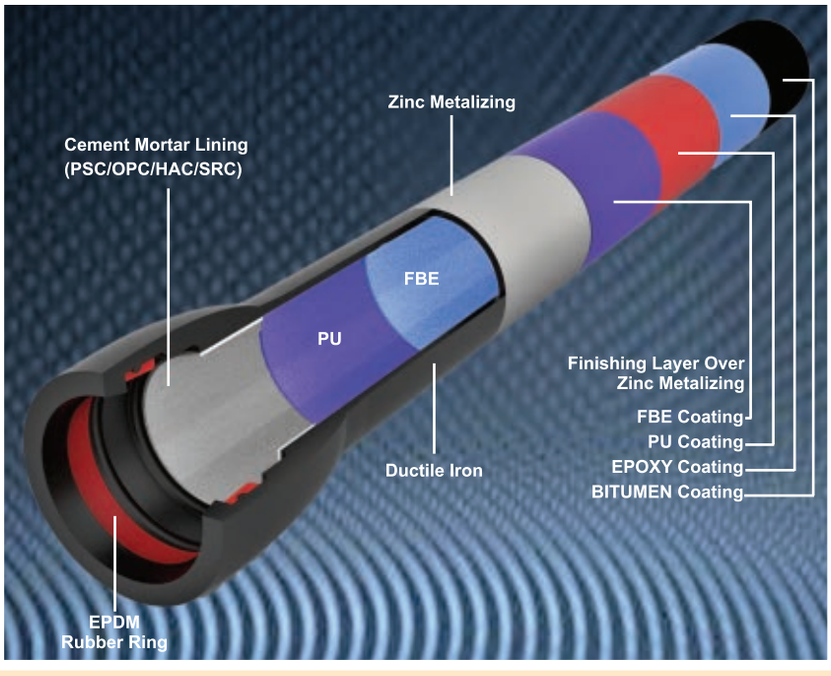
The external coating of Ductile Iron pipes comprise of a layer of metallic Zinc, followed by a finishing layer of a Bituminous/Epoxy resin. The Zinc is normally applied on oxide-free surface pipes after heat treatment or it may also be applied on blast-cleaned pipes. Prior to application of the Zinc, the pipe surface should be dry and free from rust or non-adhering particles or foreign matter such as oil or grease.

Coating Characteristics

The metallic Zinc coating covers the external surface of the pipe and provides a dense, continuous, uniform layer. The purity of the Zinc used should be at least 99.99%. The Ductile Iron pipes are manufactured by Kejriwal with the following option on the basis of Zinc mass applied to the pipe surface:

1. The mean mass of Zinc per unit area is 130g/m^2 (for pipes and fittings)
2. The mean mass of Zinc per unit area is 150g/m^2 (for pipes)
3. The mean mass of Zinc per unit area is 200g/m^2 (for pipes)
4. The mean mass of Zinc per unit area is 400g/m^2 (for pipes)
5. The mean mass of Zinc Aluminium per unit area is 400g/m^2 (for pipes)

The uniformity of the finishing layer is checked and when measured, the mean thickness of the finishing layer should not be less than 70 mm and the local minimum thickness not less than 50 mm.



Special Lining and Coatings

Seal Coat for Cement Mortar Lining

Epoxy seal coat for Cement mortar lining is provided if the customer specifies it. Unless otherwise specified by the purchaser, the minimum Dry Film Thickness (DFT) provided is average 70 micron with minimum at one point of 50 micron. The coating is uniform, free of thin spots and other imperfections.

Pipe Preparation

The pipe internally lined with cement mortar is shot blasted or buffed using a mechanical device and the cement laitance layer is thoroughly removed. The pipe is then thoroughly cleaned of all loose foreign matter with the help of clean, dry, oil free compressed air in a manner that does not adversely affect the cleaned surface. Alternatively, vacuum cleaning or other methods may be used in place of compressed air, without affecting the pipe surface.

Application of Seal Coat System

The seal coat is applied using an airless spray gun mounted on a moving boom. If more than one coat is applied, the subsequent coat is applied within the time limits, surface conditions and temperature recommended by the manufacturer.

Visual Appearance

The seal coat is uniform and when visually examined, it is free from any coating irregularities likely to be detrimental to the performance of the seal coat.

Seal Coat Repair

For minor damage to the seal coat at the ends of pipe, no repair of the seal coat is necessary.

Polyurethane Lining

Polyurethane lining material consists of two component solvent free Epoxy resin. Mineral fillers, pigments and additives are selected in order that the final product complies with the performance requirements given in BSEN 15655.

Application Method: Airless Hot Spray Method

Surface Preparation

Prior to the application of the Polyurethane lining, the surface of the pipes or fittings to be lined, should be clean, free of rust, loose constituent materials, dirt, oil, grease and moisture.

In cold weather, or any time when the moisture tends to condense on the surface of the pipe or fitting, it should be uniformly warmed for sufficient time prior to cleaning. The surface temperature should be maintained at least 5°C above the dew point.

The Polyurethane lining should be of:

- Uniform colour, except the spigot end and the internal socket profile which may be of a different colour and different coating material.
- Uniform appearance and smoothness except for admissible repairs.
- Free from visible defects (pinholes, bubbles, blisters, wrinkles, cracks or voids).

  Slight superficial variations of colour or brilliance due to repairs or prolonged exposure to sunlight of contact with other pipes are permissible.

Polyurethane Lining Thickness

Lining Thickness of Pipes and Fittings for Drinking Water Transportation		
DN	**Mean value x, µm**	**(x-26), µm**
80 - 200	≤ 1300	≤ 800
< 200	≤ 1500	≤ 800
Lining Thickness of Pipes and Fittings for Wastewater Transportation		
80 - 200	≤ 1300	≤ 800
250 - 700	≤ 1500	≤ 800
750 - 1000	≤ 800	≤ 1000
< 1000	≤ 2000	≤ 1000

Note: Higher thickness can also be provided as per customer requirement.

Epoxy (Synthetic) Coating

Epoxy coating is provided if the customer specifies it. Unless otherwise specified by the purchaser, the minimum dry film thickness (DFT) of Epoxy coating should be average 70 micron with minimum at one point of 50 micron. After curing but prior to laying of pipes, the coating should be a continuous film, free of thin spots and other imperfections.

Coating Application

The pipe coating should be applied in accordance with the manufacture's recommendations. Application of Epoxy coating is carried out by airless spray equipment.

Pipe Preparation

The pipe exterior should be thoroughly cleaned of all loose foreign matter with the help of clean, dry, oil free compressed air in a manner that does not adversely affect the cleaned surface. Alternatively, vacuum cleaning or other methods can be used in place of compressed air. Shot blasting can also be used.

Application of Epoxy Coating System

If more than one coat is applied, the subsequent coat should be applied within the time limits, surface conditions and temperature recommended by the manufacturer. If the period between coats is exceeded, then a repair procedure should be obtained from the coating manufacturer and its recommendations followed.

Coating Repair

Accessible areas of pipe requiring coating repairs should be cleaned to remove debris and damaged coating using grinders or other means acceptable to the purchaser. The adjacent coating should be feathered by sanding, grinding or other methods approved by the purchaser. Accumulated debris should be removed by vacuum blowing or wiping with clean rags.

Materials	
Polyurethane Minimum Thickness	700 microns
Non-porosity Test Voltage	4.2/6KV
Impact Test (using wire mesh/conductive rubber electrode)	10 J
Adhesion Test	8MPa
Hardness	70 Shore D

Polyurethane Coating

Polyurethane consists of high build, two components, resin. The coating is capable of airless spray application to provide an average 2mm of Dry Film Thickness (DFT) in a continuous application.

The mechanical properties of the coating should meet the requirements of DIN 30671/BS EN 15189.

Surface Preparation

Prior to the application of the Polyurethane coating, the surface of the pipes or fittings to be coated should be clean, free of rust, loose constituent materials, dirt, oil, grease and moisture.

In cold weather, or any time when the moisture tends to condense on the surface of the pipe or fitting, it should be uniformly warmed for sufficient time prior to cleaning. The surface temperature should be maintained at least 5°C above the dew point.

The surface should be prepared by grinding (only for pipes) and sand (grit) blasting.

Finished Polyurethane Coating

The Polyurethane coating should be of:

- Uniform colour, except the spigot end and the socket which may be of a different colour for permitted marking.
- Uniform appearance and smoothness except for admissible repairs.
- Free from visible defects (pinholes, bubbles, blisters, wrinkles, cracks or voids).

Slight superficial variations of colour or brilliance due to repairs or prolonged exposure to sunlight of contact with other pipes are permissible.

Minimum Coating Thickness - 700 micron.

Lay Flat Width of Tubular Polyethylene Sleeve

Nominal Internal Diameter of Pipe (mm)	Lay Flat Width (mm)
80	350
100	350
150	450
200	550
250	650
300	700
350	800
400	1100
450	1100
500	1350
600	1350
700	1750
800	1750
900	2000
1000	2000
1100	2500
1200	2500
1400	2750

Note: Actual lay flat width of the tubular film shall not differ from the nominal by more than ± 2.5%

Polyethylene Sleeve

Protective Polyethylene sleeves are used to cover DI pipes and fittings installed in buried conditions and accordance to ISO 8180.

The Polyethylene sleeve is black in colour and resistant to the effect of ultra violet light.

The material is made from a polymer with a melt flow index as measured according to BS 2782, of 10 or less and a density in the range of 0.910 to 0.935 g/ml. The sleeve is free from pinholes, gels, undispersed raw materials and particles of foreign matter. The film shall not contain more than 5% by weight of material other than Polyethylene.

The material used for making the film is Polyethylene or a mixture of Polyethylene and or Ethylene and Olefin co-polymers. Its density should be between 910 and 930 kg/m^3. Polyethylene sleeves are stored in a cool dry store, away from direct sunlight or excessive heat.

Thickness

The nominal thickness of the sleeving should not be less than 200 mm and not more than 250 mm unless otherwise agreed. The negative tolerance on the nominal thickness shall not exceed 10%. If necessary, it is permitted to use thicker sleeving or double sleeving.

Mechanical Properties

Tensile strength of the film in the longitudinal and transverse direction should not be less than 8.3 MPa.

The elongation at the fracture of the film in the longitudinal and transverse directions should not be less than 300%.

The dielectric strength of the film should be 31.5 V/mm minimum.

Manufacturing Process of Ductile Iron Pipes

Molten Iron Preparation : Molten metal is produced in the Induction furnace. The super heating and chemical correction of the molten metal is done by adding required quantity of Mild Steel scrap. The molten metal from the Induction Furnace is further taken into converter and Magnesium is added to convert the graphite into spheroidal shape.
The molten metal treated with magnesium is transferred to the casting platform.

Centrifugal Casting : The molten metal is poured into the water-cooled jacketed metallic centrifugal casting machine, spinning at high speed. The mould is cooled by the water flowing in the jacket which helps in solidifying the molten metal in the form of a pipe. The casted pipe is extracted by an extractor and transferred to annealing furnace.

Annealing : Annealing is a heat treatment wherein a material composition is altered, causing changes in its properties such as strength and hardness. Annealing is used to induce ductility, soften material, relieve internal stresses, refine the structure by making it homogeneous and improve cold working properties. Annealing furnace is a horizontal chain style furnace made up of heating section, heat holding section, slow cooling section and fast cooling section. The Ductile Iron pipe, after entering the furnace, is pushed rolling forward by claws on chains driven by a speed regulating motor.

Zinc Coating : After heat treatment the DI pipe is transferred to Zinc Coating section where the Zinc wire is melted using electric arc and applied to the external surface of the pipe by spraying evenly.

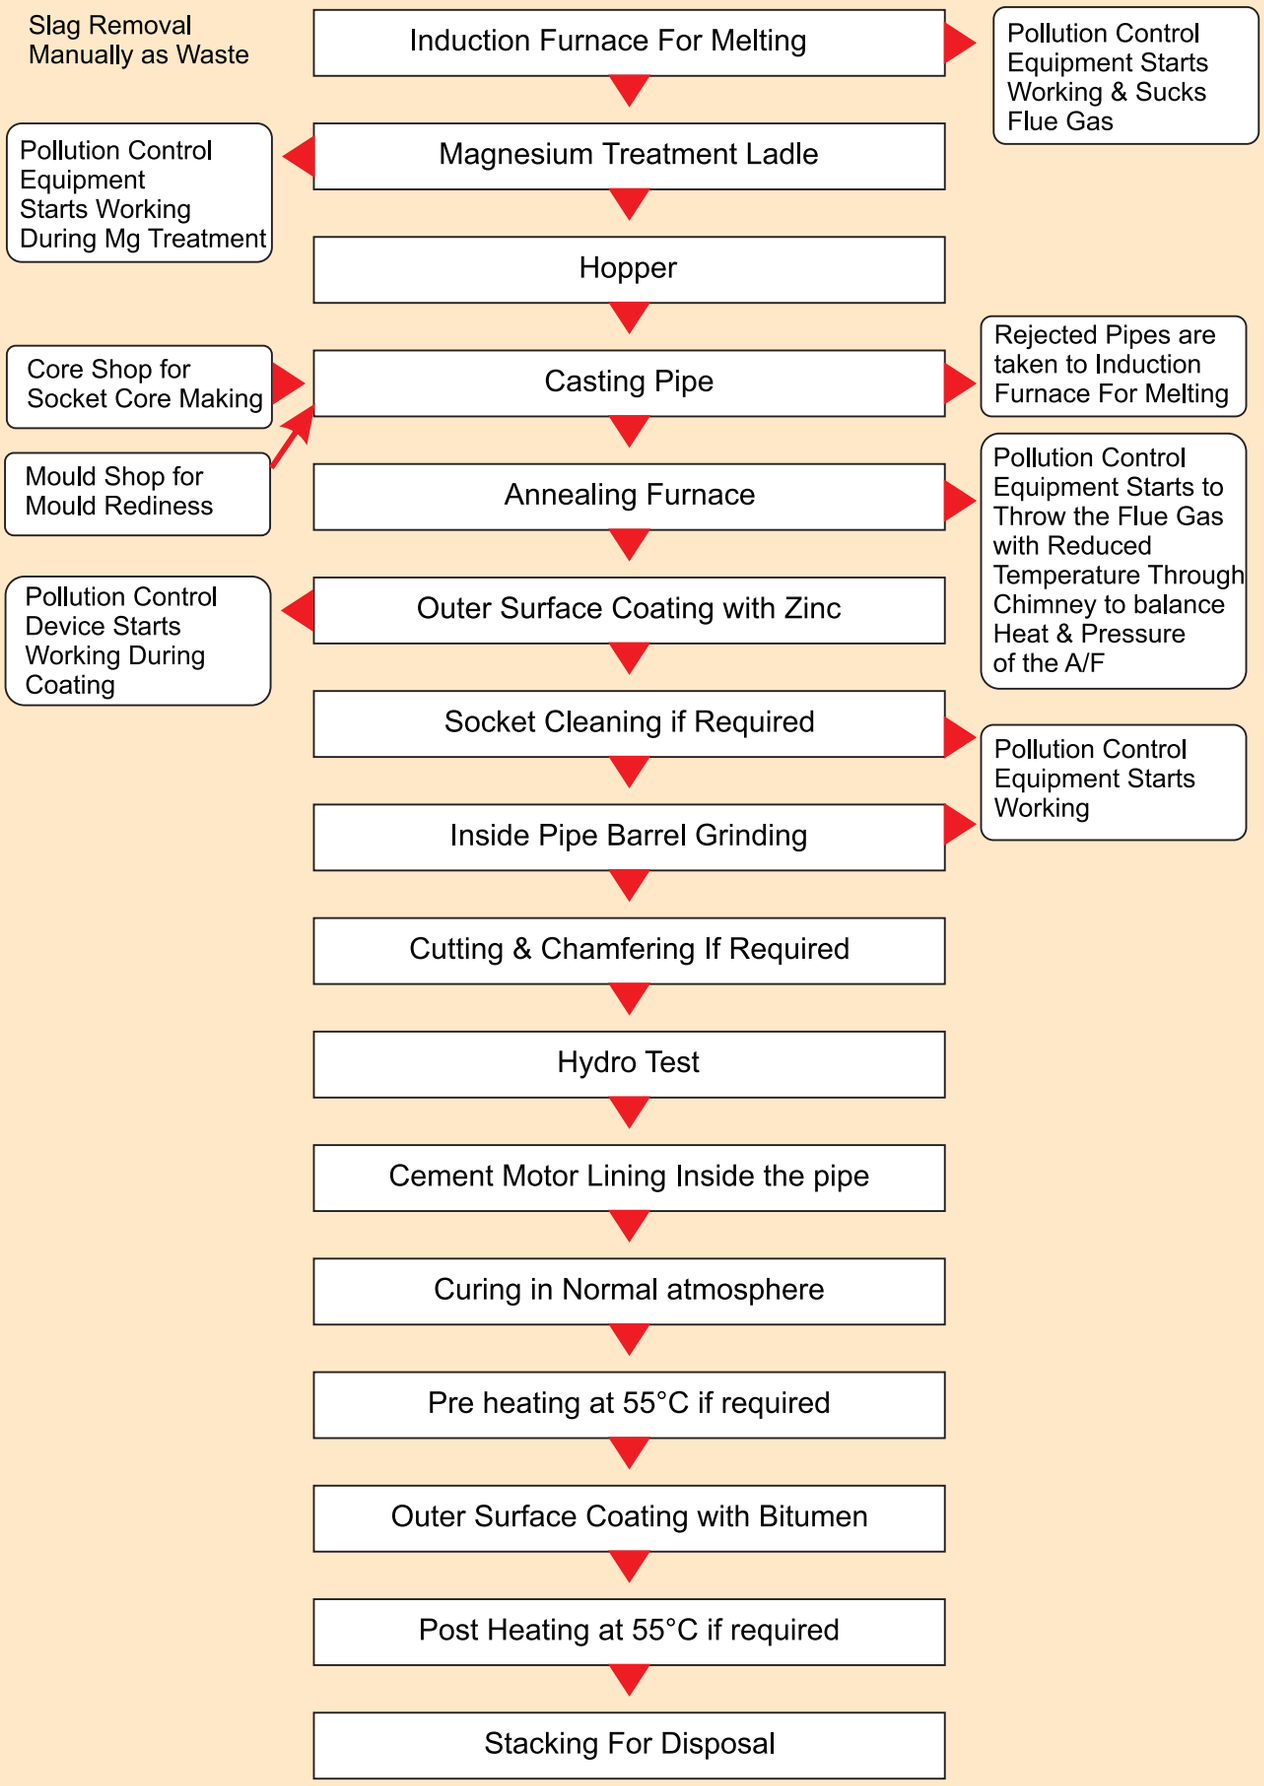
Hydrostatic Testing : After Annealing, bell and spigot end, internal and external surface of the DI pipes are finished to remove fins and so on, and then checked for their dimensions. After cleaning and finishing, Ductile Iron pipes are hydro tested one by one as per the standard specification and requirements.

Cement Lining : A mixture of cement, sand and water as per specified proportion is pumped through a lance into the pipe spinning at low speed. The pipe is then rotated at high speed where excessive water from the cement slurry is discharged leaving behind dense cement mortar lining the internal surface of the pipeline. Cement lining is then passed to the curing chamber where the desired humidity is maintained.

Bitumen Coating : After curing the DI pipes are transferred to Bitumen/Epoxy coating stations. The anti-corrosive Bitumen/ Epoxy layer is applied to external surface of pipes and internal surface of socket. The Bitumen/Epoxy layer applied must be even, without any trace of dripping or flowing. The pipes after coating, are transferred to drying chambers.

Marking, Packing and Shipping : The pipes coming out of drying chambers are marked with installation mark at spigot end and various marking as per specification including the trade mark, if any, are painted on the external surface of pipes. After marking, the pipes are transferred to yard for final inspection and dispatch to respective clients.

Flow Chart Of Manufacturing Process Of Ductile Iron Pipes



Plant Overview

Total Capacity: 100,000 MT per year Machines Allocation:
2 Machines for DN 80 to DN 200: Capacity of 40,000 MT.
2 Machines for DN 80 to DN 400: Capacity of 60,000 MT.

Detailed Process Flow-Chart

1. **Raw Material Handling**

   Inputs: Pig iron, metal scrap

   Process: Sorting and preparation of raw materials; metal scrap is cleaned, and quality pig iron is selected.

   Equipment: EOT crane with magnet.

   Temperature: Ambient.

2. **Melting and Alloying**

   Equipment: Induction furnaces

   Process: Pig iron and scrap are melted; composition is adjusted to meet specifications.

   Temperature: 1450°C to 1500°C

   Time: 40 minute to 45 minute for 04 MT.

Composition:

Percentage	Composition %
C %	- 3.3 to 3.9
Si %	- 1.60 to 2.20
Mn %	- 0.50 Max
P %	- 0.150 Max
S %	- 0.070 Max
Ti %	- 0.150 Max
Cr %	- 0.100 Max
Mo %	- 0.100 Max
Ni %	- 0.080 Max

Additives: Silicon and carburiser (to meet the composition)

3. **Spheroidization**

   Additives: Pure magnesium ingot.

   Process: Treatment with pure magnesium ingot to modify graphite structure and stabilize the microstructure.

   Temperature: 1450°C to 1500°C for spheroidization.

   Equipment: Treatment vessel with tilting mechanisms.

4. **Quality Control**

   Process: Chemical analysis (Mg%- Min 0.030 & S%- Max 0.020) after magnesium treatment.

   Equipment: Coin sample testing in Spectrometer.

   Temperature: Ambient.

5. Centrifugal Casting

Equipment Split:

2 Machines for DN 80 to DN 200

2 Machines for DN 80 to DN 400

Process: Molten iron is poured into centrifugal casting machines. Machine specifications differ based on the pipe size to optimize production.

Temperature: Molten iron at 1400°C, cooling to ambient.

Output Rate: 40,000 MT/year for smaller diameters, 60,000 MT/year for larger diameters.
Additives: Mould powder & Inoculation powder to modify graphite structure and stabilize the microstructure.

Thickness:

Size	Thickness			
	K7		K9	
	Min. (mm)	Nom. (mm)	Min. (mm)	Nom. (mm)
DN 80	5.0	5.0	6.0	6.0
DN 100	5.0	5.0	6.0	6.0
DN 150	5.0	5.0	6.0	6.0
DN 200	5.0	5.0	6.0	6.3
DN 250	5.0	5.3	6.0	6.8
DN 300	5.0	5.6	6.0	7.2
DN 350	5.0	6.0	6.05	7.7
DN 400	5.0	6.3	6.4	8.1

6. Quality Control

Process: Dimensional checks, thickness check, casting defects and visual inspection.
Equipment: Pistol calliper, diameter tape and ultrasonic testing.
Temperature: Ambient.

7. Annealing

Equipment: Continuous annealing oven
Process: Heat treatment in controlled environments to relieve internal stresses and achieve desired mechanical properties. This involves heating the pipes to approximately 900°C, then slowly cooling them to achieve a uniform austenitic matrix, which is later transformed into a ferrite-pearlite structure.
Temperature: Up to 900°C, then slow-cooled.

8. Quality Control

Process: Microstructure analysis (Carbide max 10%, Pearlite max 25% & Ferrite min 75%), dimensional checks.
Equipment: Go gauge, no go gauge, diameter tape and metallurgical microscope.
Temperature: Ambient.

9. Zinc Coating:

Instead of a dip in molten zinc, a hot zinc metal spray is applied. This involves spraying molten zinc onto the rotating pipe to form a uniform, corrosion-resistant coating. This method is particularly effective as it allows for precise control over the thickness of the zinc layer and ensures complete coverage of complex surfaces. Temperature: Ambient for cleaning; the zinc is sprayed at temperatures high enough to keep it molten (around 400°C to 450°C).

Equipment: Zinc spray guns, which are specifically designed for high-temperature metal spraying, and pipe rotation mechanisms that ensure even application of the zinc coating. Zinc coating thickness: Minimum 110 gm/m^2 & Nominal 130 gm/m^2.

10. Cutting & Chamfering

Process: All pipes are checking for chamfering and some pipes are selected for ring cutting to mechanical testing process.

Equipment: Cutting & chamfering machine.

11. Quality Control

Process: Mechanical testing and zinc mass measurement.

Equipment: Mylar sheet, weighing balance, universal testing machine, BrinelL hardness testing machine, Vernier calliper.

Mechanical properties: Tensile 420 MPa Min
Elongation 10% Min
BHN 230 Max

Temperature: Ambient.

12. Socket & barrel grinding

Process: Socket lip grinding, metal removal and socket groove cleaning.

Equipment: Barrel grinding machine, straight grinder.

13. Hydro testing

Equipment: Automated hydro test machinery.

Process: Each pipe undergoes online 100% hydrostatic testing. This involves filling the pipe with water at a specified pressure higher than its operational pressure to ensure there are no leaks or weaknesses in the pipe structure.

Temperature: Ambient.

Quality Check: This stage is crucial for validating the integrity of the pipe under pressure. All pipes must pass this test before moving on to the coating stages.

Hydrostatic test:

Size	Pressure		Holding Time
	K7	K9	
DN 80	32 kg/cm²	50 kg/cm²	10 seconds
DN 100	32 kg/cm²	50 kg/cm²	10 seconds
DN 150	32 kg/cm²	50 kg/cm²	10 seconds
DN 200	32 kg/cm²	50 kg/cm²	10 seconds
DN 250	32 kg/cm²	50 kg/cm²	10 seconds
DN 300	32 kg/cm²	50 kg/cm²	10 seconds
DN 350	25 kg/cm²	40 kg/cm²	10 seconds
DN 400	25 kg/cm²	40 kg/cm²	10 seconds

14. Lining

Types of Lining:

Cement Mortar Lining: Applied using a spinning process.

Polyurethane Lining (Optional): For enhanced corrosion protection.

Equipment: Rotating cement mortar lining machines, polyurethane spray systems.

Temperature: Ambient; controlled curing conditions.

Quality Check: Cement lining thickness check with tyre depth gauge in wet condition and check bore clearance with bore gauge in dry condition.

Thickness & Bore clearance:

Size	Lining Thickness (mm)		K7 Bore clearance (mm)
	Min	Nom	
DN 80	1.5	3.0	82
DN 100	1.5	3.0	102
DN 150	1.5	3.0	154
DN 200	1.5	3.0	206
DN 250	1.5	3.0	257
DN 300	1.5	3.0	309
DN 350	3.0	5.0	356
DN 400	3.0	5.0	406

15. **Pre-heating**

Process: Before preheating pipe to be free from oil/grease/dust and then pipe to be heated up to 55°C for moisture removal.

Equipment: Pre-heating furnace.

Temperature: Up to 55°C.

Process: Before preheating pipe to be free from oil/grease/dust and then pipe to be heated up to 55°C for moisture removal.

Equipment: Pre-heating furnace.

Temperature: Up to 55°C.

16. **Bitumen/Epoxy Coating:**

Following the external coating application, a protective layer of bitumen or epoxy is applied to further protect the pipe from external corrosion. This layer also improves the pipe's aesthetic appearance and provides a smoother surface, which can be critical for certain applications.

Temperature: Epoxy is applied at ambient temperatures. Equipment: Spray or brush application setups for bitumen or epoxy. Coating thickness: Minimum 50 microns & Nominal 70 microns.

17. **Post-heating**

Process: After bitumen/epoxy coating post heating run for fast paint drying purpose.

Equipment: Post-heating furnace.

Temperature: Up to 55°C.

18. **Water sprinkler:**

Sprinkling with water is performed in this station.

19. **Quality Control**

Process: Dimensional checks, ultrasonic testing, hydrostatic testing, and visual inspection.

Equipment: Testing stations equipped with necessary tools and gauges.Temperature: Ambient.

20. **Finishing and Dispatch**

Process: Marking for traceability, application of end protectors, packing, and storage.

Equipment: Marking machines, packing stations.

Temperature: Ambient.

This refined process flow-chart takes into account the specifics of the plant's production capabilities and equipment allocation, ensuring a detailed overview of the entire manufacturing process tailored to the specific capacities and size ranges handled by the plant. This setup optimizes the utilization of equipment and materials for efficient production flow.

Quality Control

Quality Control (QC) is a collection of methods and techniques for ensuring that a product is conforming to standards and is produced & delivered according to given requirements.

Quality is measured by the degree of conformance to pre-determined specifications and standards, and deviations from these standards can lead to poor quality and low reliability. Efforts for quality improvement are aimed for elimination defects, reduction of rejection and hence overall reductions in production costs. Quality checks done on Ductile Iron pipes include the following parameters:

1. **Thorough Check of all Raw Materials for Compliance with Respective National and International Standard Specifications**
2. **Chemical Analysis**
   - Composition of molten metal
   - Chemical analysis
3. **Mechanical Test**
   - Tensile strength
   - Elongation
   - Hardness
   - Microstructure
4. **Dimensions**
   - Sample checking for socket dimensions
   - Checking on external diameter
   - Checking internal diameter
   - Pipe thickness
   - Length of pipes
   - Ovality
   - Straightness of pipes, chamfering of spigot end
5. **Surface Defect Checks**
   - Pin holes
   - Pitting
   - Cut marks
   - Surface netting/imperfection
   - Excess mould powdering/undissolved mould powder
6. **Casting Defects Checks**
   - Cold shots
   - Lapping of metal surface
7. **External Coating - Online Quality Checks**
   - Measurement of Zinc/Zinc Aluminium mass deposit on pipe surface
   - Measurement of finishing layer (Bitumen/resin) thickness on pipe surface
8. **Internal Lining - Online Quality Checks**
   - Checking of type of cement being used
   - Checking of water cement and sand ratio
   - Checking of cement-sand ratio
   - Checking of wet CML thickness
   - Checking for uniform holiday free seal coating over cement mortar lining (if seal coat provided)

Stages of Manufacturing and Quality Checks

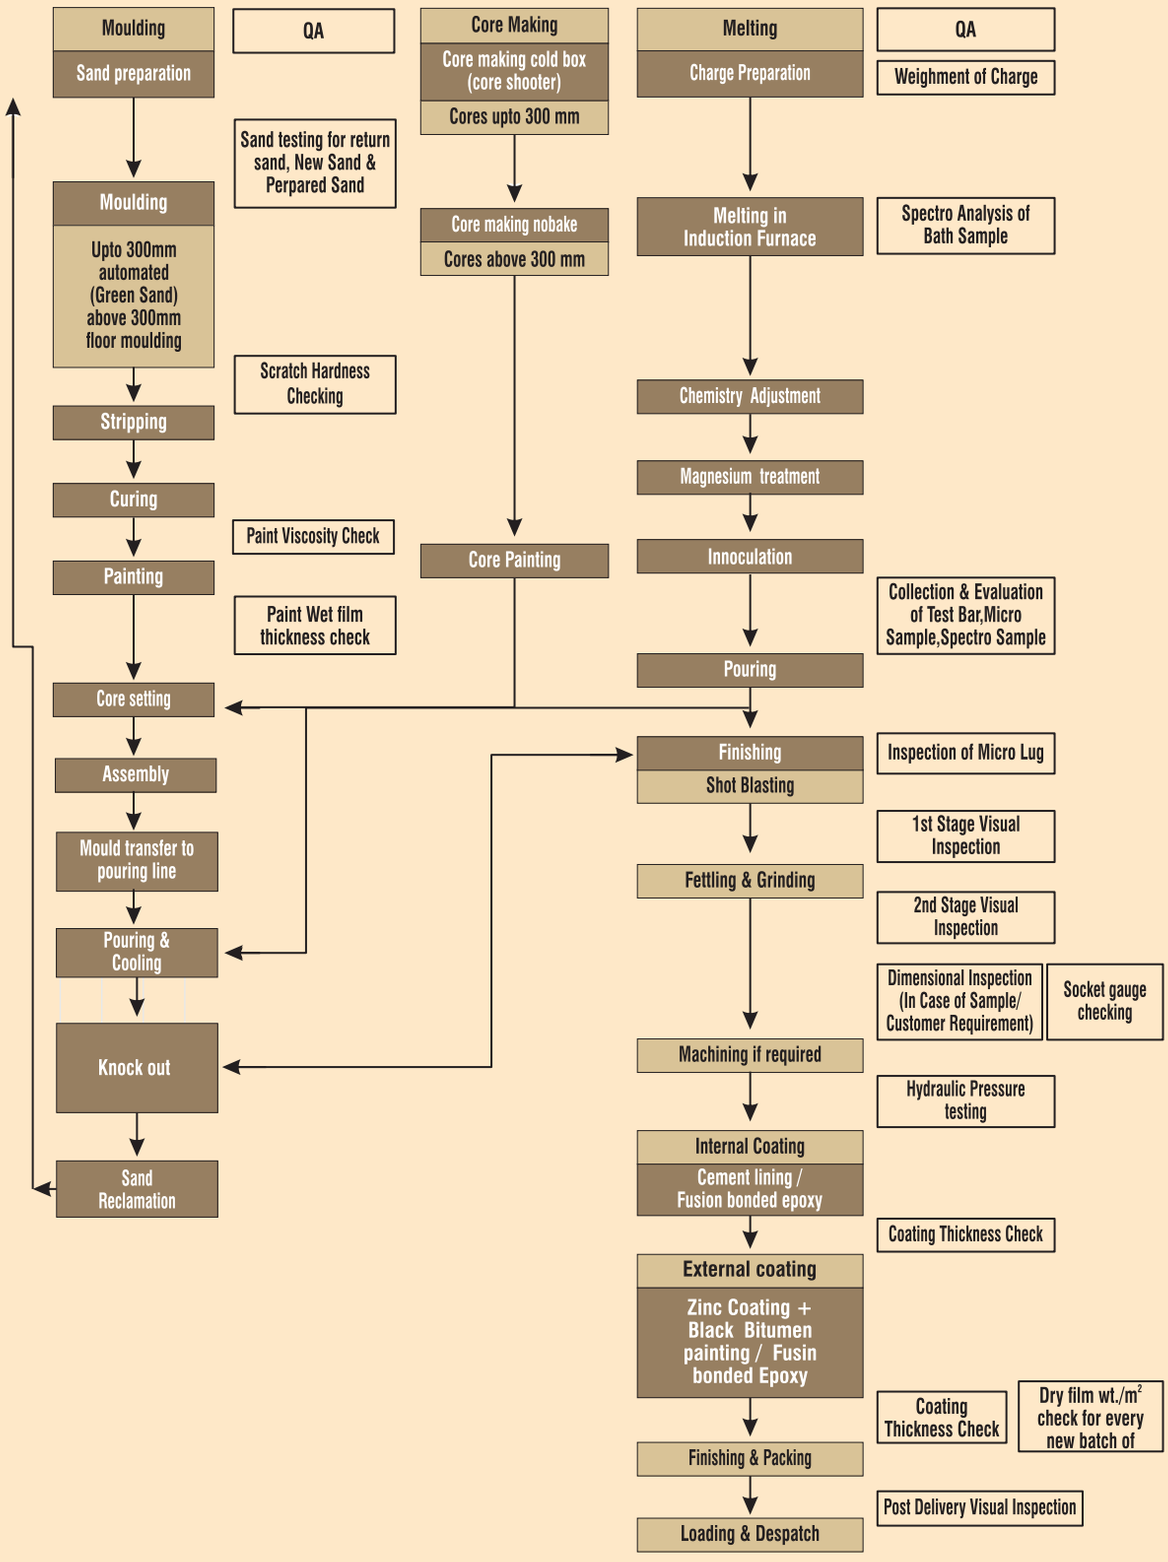
Ductile Iron Pipes

All the tests mentioned earlier are carried out at different stages of production as shown in the following flow chart:

Stages of Manufacturing	Quality Checks
Raw Material Receipt / Storage	Analysis of Raw Material According to Specification for Every Consignment
Liquid Metal Furnace	Chemical Analysis, Temperature
Chemistry Adjustment and Super Heating In Induction Furnace	Chemical Analysis
Magnesium Treatment in Converter	Temperature and Chemical Analysis, Addition of MS Scrap if Required
Pipe Casting	Magnesium Addition by Weight/Length of Wire
Heat Treatment (Annealing)	Spinning Parameter; Temperature, Core for Socket, Mould for Pipe, Inoculation Powder/ Mould Powder
Zinc Coating	Physical Test, Microstructure
Finishing	Zinc Mass Deposit and Continuity
Hydrostatic Pressure Testing	Socket Grove; Visual; Gauging; Spigot Ends for Champhering
Cement Mortar Lining	Pressure Rating, Body Leak and Sweat
Steam Curing	Cement/ Sand/Water Ratio, Thickness. Bore Checking and Uniformity
Bitumen Coating	Temperature; Humidity; Visual and Gauging
Marking	Thickness and Continuity
Stacking & Bundling (if required)	As Per Specification and Client Requirement
Party/ Third Party Inspection	Type of Stacking, Recommended Height and Strength of Bundle
Dispatch	To Ensure Correct Ordered Material Supplied

Flow Chart of Manufacturing Process

Ductile Iron Fittings



Sample Size

To carry out inspection it is practically not possible to check each and every pipe. Hence the sample pipes are segregated from the LOT. The sample size should be as follows:

Sample Size for Different Lots of Pipe Diameter

S. No.	Lot Size (Numbers)	Sample Size (Numbers)	Acceptance (Numbers)
1	Upto 50	8	0
2	51 to 100	13	1
3	101 to 150	20	1
4	151 to 300	32	2
5	301 and above	50	3

Note: From the above sampled size randomly selected pipes are sent for mechanical properties test and chemical composition test.

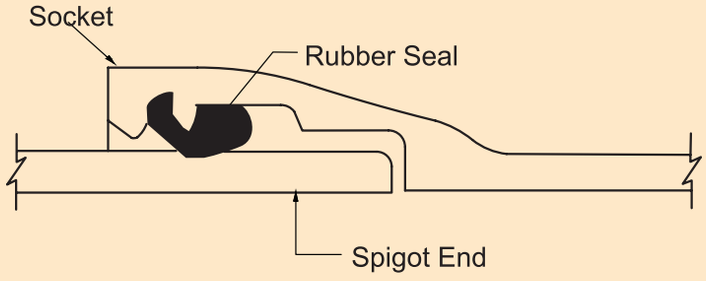
Joints, Allowable Deflection, Type Test

Ductile Iron Pipes can be joined by four types of Joints -

1. Push-on Joint; 2. Mechanical Joint; 3. Flange Joint; 4. Restrained Joint

Push-on Joint

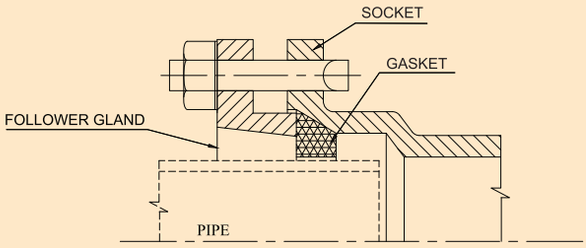
This joint is commonly and widely used. Ductile Iron pipes comprise of socket and spigot ends. The inside surface of the socket has grooves to hold the rubber gasket. The gasket has a hard part called the 'heel' which gets engaged in the groove of the socket to firmly hold the gasket. The other part of the gasket is the bulb portion which is comparatively softer than the heel portion of the gasket. Both softer bulb and the harder heel portions of the gaskets are vulcanized to form a circular single part. The spigot of the next pipe has a taper portion to facilitate smooth insertion of the spigot end in to the socket of the pipes. The spigot is inserted into the socket holding the rubber gasket. The spigot exerts uniform circumferential pressure over the soft portion of the rubber gasket and the pipe is pushed in to the socket until one line of the insertion mark gets into the socket and the other insertion mark is visible. This is to ensure that a small gap is left between the two pipes in order to ensure the deflection in the pipeline and also to accommodate the linear expansion due to thermal effect on the pipeline laid above ground. In this fashion the pipeline is made continuously.



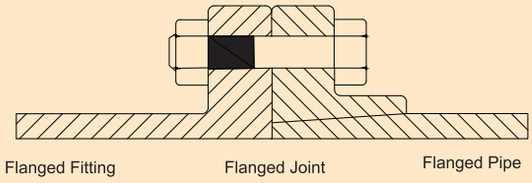
Push on Joint

Mechanical Joint

This joint is used where it is difficult to effect Push-on joint. This joint can also be used to make good a leaking pipe in a pipeline. This joint is also a type of Push-on joint but unlike in Push-on joint the rubber gasket is tightened to exert circumferential pressure on spigot of the pipe to provide a positive seal. This joint comprises a gland, a trapezium shaped gasket and set of bolts, nuts and washers. The socket of the pipe in this joint has a circumferential collar to facilitate gripping of the hooks bolts used in this joint. In order to complete this joint the metal gland is inserted over the spigot end of one pipe. The gland has sufficient number of bolt holes. The gland is of 'L' shaped. The socket of the next pipe to be joined will not have any groves inside but the internal diameter will be sufficient enough to accommodate a trapezium shaped rubber gasket. This trapezium shaped gasket is inserted over the spigot of the pipe where the gland is already inserted. The spigot of pipe with the gland and rubber gasket is inserted in to the socket of the next pipe and bolts are inserted into the gland in such a manner that t he hook heads are towards the socket of the pipe to be joined. The gland along with rubber gasket brought closer the socket of the next pipe and the bolts are tightened from gland side so that proper gripping of the hook bolts over the circumferential collar of the socket is ensure. The gland pushes the rubber gasket and presses it so that the circumferential seal is effected after jointing.



Mechanical Joint



Flanged joint

Flange Joint

Flange joints are rigid joints. Flanges are fixed on either ends of barrel pipe piece. This type of joint can be made in Ductile Iron pipes in three different manufacturing processes. They are:

1. **Integrally Cast flanged pipes:50**

   In Intregally cast flanged pipes the Ductile Iron pipes with flanges are cast in foundries with integrally cast flanges on them. These flange pipes are normally of very small length say 1 to 1.5 m. They are heavier to handle and one may have to use many pipes for vertical lift and as much extra bolts, nuts etc. This type flange pipes are used for very small lengths.

2. **Welded-on flanged pipes:**

   In Welded-on flanged pipes the flanges are welded on to the ends of the pipe barrels.

3. **Screwed-on flanged pipes:**

   In screwed-on flanged pipes both flanges and barrels of DI Pipes are provided with female and male threads respectively. The flanges are threaded over the DI Pipe barrel.

   The jointing of the two flanged end pipes is done by placing gaskets in between the flanges and tightening the flanges with bolts, nuts and washers.

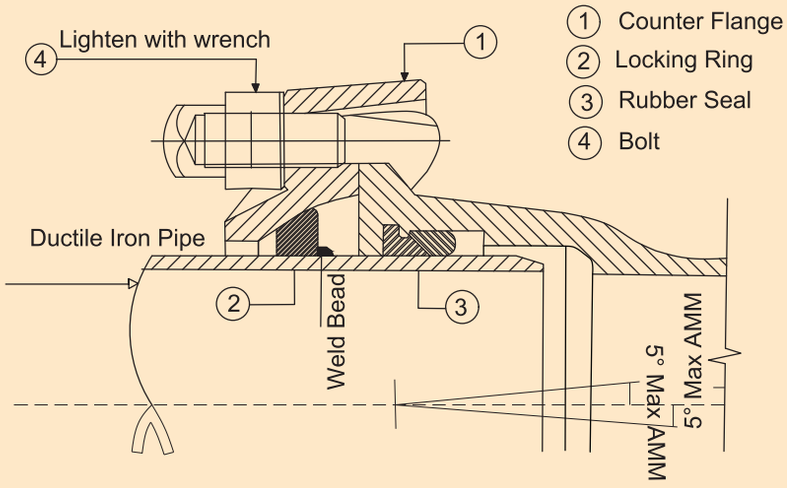
Classification of Flanged Pipes

Size Range (mm)	Pressure Class (N/mm^2)
80 - 1200 mm	PN 10
	PN 16
	PN 25
	PN 40
1400 - 2600 mm	PN 10
	PN 16
	PN 25

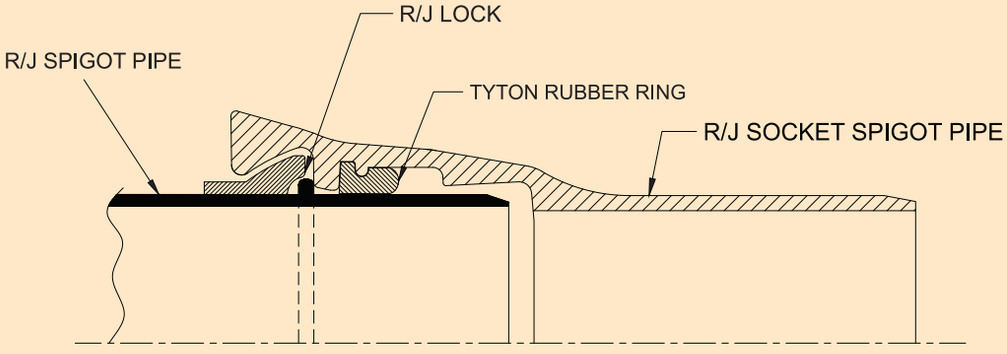
Restrained Joint Pipes

The Ductile Iron pipes are supplied to suit and facilitate restrained jointing in which the axial movement of the pipe is arrested by mechanical means. The DI pipes with these joints are ideally suitable for the pipe line to be laid over loose soil or marshy land where one cannot provide anchor blocks at Tee points, or bends etc. Restrained Jointed DI pipes are used for high pressure water transmission. It is also used where the pipeline traverses a hilly terrain. This joint comprises an assembly of socket and spigot pipes with glands, split ring and a set of hook bolts, nuts and washers. The spigot end of the pipe is provided with a weld bead. The socket of the pipe to be joined, have a circumferential projected collar. The procedure for jointing two pipes is as under:

- The gland made of SG iron have an internal diameter slightly above the dimension of the weld bead outer diameter. The gland is slid over the spigot end of the pipe and rested.
- The split ring or arrester ring or retainer ring has an internal diameter exactly as that of external diameter of the pipe barrel. The split ring is opened slightly and slid over the weld bead and rested within the gland in such manner that the taper of the spit ring and the inside taper of the gland match exactly.
- Insert the rubber gasket into the socket of the next pipe to be joined.
- Make the jointing of the two pipes by inserting the spigot end of one pipe into another.
- Move the gland along with split ring towards the socket of the next pipe till the weld bead on to spigot of the pipe.
- Insert the hook bolts from the socket side into the gland and start tightening using bolts, nuts and washers.
- Complete tightening to ensure restrained jointing.



Restrained Joint



Double Chamber Retrained Joint

Calculation of Length of Pipeline to be Restrained

Restrained Joint System functions in a manner similar to thrust blocks. The thrust force is balanced with the reactive forces generated by the restrained unit of the piping with the soil.

The design of the thrust resistant system will determine the length of the pipe that must be restrained on each side of the focus of the thrust force. The length of restraint of the pipe will be a function of pipe size, the internal pressure, depth of cover, the characteristic of the soil surrounding the pipe and the type of encasement of pipe.

The calculation of length that must be restrained is independent of the system of anchoring used. The source of restraining force is two fold:

i) The static friction between the pipe unit and the soil.

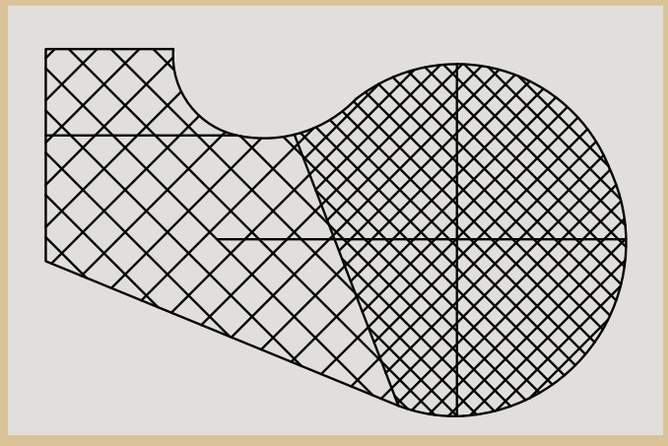
ii) The restraint provided by the pipe as it bears against the side fill soil along each leg of the bend.

Rubber Gaskets for Flexible Jointing System

Rubber Gasket provides leak tight flexible jointing system in Ductile Iron pipelines. Earlier natural rubber was used, but with the advancement in technology SBR (Styrene Butadiene Rubber) gaskets and lately EPDM (Ethylene Propylene Diene Monomer Rubber) gaskets are being successfully used for the jointing system. For special service conditions, Nitrile Butadiene Rubber (NBR) and Fluoro-Carbon gasket are also used.

The Rubber gaskets provide satisfactory sealing of up to 100% compression set. Extrapolated test results like 'Compression Set' & 'Stress Relaxation' on Rubber gaskets have indicated the life of Rubber gasket to be more than 100 years. Moreover, the rubber gasket in a pipe joint is cut off from sunlight, Oxygen contact, Ozone contact and UV radiation, and temperature variance, which enhances the durability of the gasket.

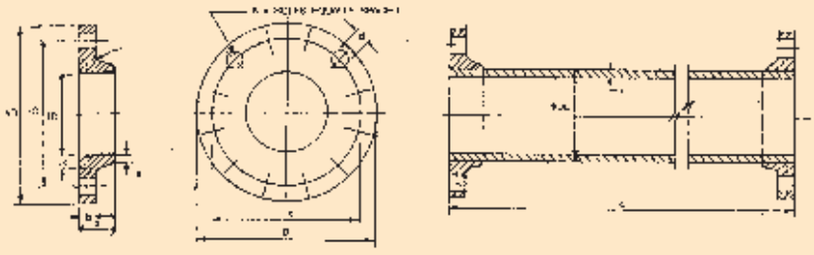
Rubber Gasket



Sectional details of Push on Joint Gasket

A rubber gasket consists of two parts, the harder part called 'Heel' and a softer part called 'Bulb' as shown in the figure. The Heel is the anchorage part of the gasket, which rests in the groove and anchors the gasket from turning over during jointing. This zone has a hardness range of 75 - 85 in the Shore A hardness scale. The bulb is the softer section, which plays the main role in sealing the gap between the socket internal and spigot external. This has a hardness range of 55 - 65 in the Shore A hardness scale.

Double Flanged Pipes



Dimensions of centrifugally cast ductile iron pipes with screwed / welded flanges

Nominal Diameter	Outside Diameter	Wall Thickness	App. Mass (kg) of One Flange		App. Mass of Barrel/mtr.	Mass (kg) of One working Length "L" including Two Flanges					
						PN - 10			PN - 16		
DN	DE	e	PN-10	PN-16	Non-CML	2.75M	5.0M	5.4M	2.75M	5.0M	5.4M

NOTE:

1. The method of screwing and the exact form of thread are as per our own discretion as the flanges are never removed after screwing on to the barrel of the pipes.
2. if so required the flanges may be spot welded on the back side after screwing.
3. Alternatively the flanges may be completely welded on to the barrel pipes.
4. Pipes = K 9 or that of higher class.
5. Only weldable Flanges may also be supplied to be welded on to the pipes as per site requirements
6. Puddle flanges (for wall casting) may be welded on pipes as per customer's requirements.

*All dimensions are in millimetres.

FITTINGS

Ductile Iron Fittings

Kejriwal
CASTINGS LIMITED

We manufacture wide variety of DUCTILE IRON FITTINGS

Socket End Fittings
Tyton socket end Fittings (‘T’ type)
Mechanical Joint end Fittings (‘K’ type)

Flange End Fittings

Restrained Joint Fittings

Fittings Suitable for OPVC Pipes

Fittings Suitable for UPVC Pipes

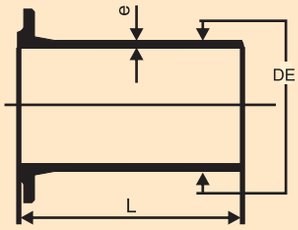
Ductlle Iron pressure pipe fittings are suitable for use with Ductile Iron pressure pipes having Socket or Flanged ends.



- As per BS-EN-545 / ISO-2531, Tees are K-14 only.
- e = K(0.5+0.001 DN)

2200	2288	+1/-9.3	32.4	37.8	-4.50

All fittings are of **K-12** Class except Tees which are available in both **K-12 & K-14** Class

A. Zinc Coating :

Zinc Rich Paint or metallic zinc wire for metallising / spraying should have at least 99% zinc by mass & min. 85% zinc in dry film.

Zinc metalising = Average min. mass 130 g/m^2 (local min. 110 gm/m^2)

Zinc Rich Paint = Average min. mass 150 gm/m^2 (local min. 130 gm/m^2)

Conversion

gm / m^2	Microns (Approx.)
110	15.4
130	18.2
150	21.0

B. Bitumin Coating :

Local thickness min. 50 μm & mean thickness 70 μm & to withstand 0°C to 65°C temperature.

C. Cement Mortar Lining (CML) :

Cement to Sand Ratio should be min. **1 : 3.5**

Size	CML Thickness (mm)	Tolerance
80 to 300	4 mm	-1.5
350 to 600	5 mm	-2.0
700 to 1200	6 mm	-2.5
1400 to 2000	9 mm	-3.0

D. Seal Coat :

A seal coat of Bitumen or any other epoxy paint may be given on CML to minimize lime leaching if required specifically.

*All dimensions are in millimetres.

TABLE - 10 Mechanical properties of Fittings (IS-1865)

Nominal Diameter (mm)	Type of Castings	Tensile Strength (mm) (Mpa)	Elongation at break (%)	Hardness (HBS) max.
All Size	Fittings	420	5 (min)	250

TABLE - 11 Hydrostatic Test pressure for Fittings

Nominal Diameter DN (mm)	Work Test Pressure Kgf/cm^2
80 to 300	25
350 to 600	16
700 to 2200	10

The fittings are kept under pressure for 10 secs which it should withstand without showing any leakage and sweating.

Tolerances on the Flange External Diameter D and Raise face E

DN	80	100	125	150	200	250	300	350	400	450	500	600
Tolerance on D	± 4.5			+5.5-2.5				+6.5-3.5				
Tolerance on E	± 4.0			± 4.5				± 5.0				

DN	700	750	800	1000	1100	1200	1400	1600	1800	2000
Tolerance on D	+7.5 - 4				+8.5 - 4		+10 - 5	+12 - 6		
Tolerance on E	±5.5				± 5.5		±6.0	± 6.0		

Tolerances on Thickness of Flange

Type of Flange	Tolerance
Intergrally Cast flanges	± (3+0.05b)
Welded and screwed on flanged	± (2+0.05b)

The tolerance on the wall thickness of fittings

Type of Casting	Wall Thickness (mm)	Tolerance (mm)
Fittings	ii) upto 7	-2.3
	ii) Greater than 7	-(2.3+0.001 DN)

Deviation on Lengths of Fittings

Type of Fittings	Nominal Diameter DN (mm)	Deviation in L and H (mm)
Flanged sockets, Flanged spigots, Collars, Tapers	80 to 1200	± 25
	1400 to 2000	± 35
Tees	80 to 1200	+ 50/ – 25
	1400 to 2000	+ 75/ – 35
Bends 90^O (1/4)	80 to 2000	± (15 + 0.030 DN)
Bends 45^O (1/8)	80 to 2000	
Bends 22^{O}30' and 11^{O}15' (1/16 & 1/32)	80 to 1200	± (10 + 0.020 DN)
	1400 to 2000	± (10 + 0.025 DN)

Tolerances on Raised Face Height (f)

Height of Raised	Tolerance
3	+1.5-2.0
4	+2.0-3.0
5	+2.5-4.0

(minimum 1 mm required)

Tolerances on Flange Drilling Dimension Bolt Hole Diameter

	Dia 19 to Dia 28	Dia 31 to Dia 56	Above Dia 62
Bolt hole diameter, d	+2 - 0	+3 - 0	+ 4 - 0
Pitch circle diameter, C	±2	±2.8	±4.8
Centre-to-centre of Adjacent bolt holes	± 2	± 2.8	± 4.8

COATING

Fittings and accessories are normally internally and externally coated. Normally Bituminous paint is applied. However following coating may also be done under agreement.

External Coating

1. Zinc rich paint/Zinc metallisation
2. Bituminous Paint
3. Epoxy Liquid Coating
4. Fusion Bonded Epoxy Powder coating (F.B.E.)
5. Poly Urethane Coating
6. Rilsan Coating

Internal Linings

The following lining may be applied depending on the internal conditions of use :

(1) Portland cement mortar
(2) Blast furnace slag cement mortar
(3) High alumina (HAC) cement mortar
(4) Sulphite Resistant Cement Mortar (SRC)
(5) Bituminous paint
(6) Poly Urethane Coating

DUCTILE IRON
UPVC & OPVC PIPES

Ductile Iron Fittings

Suitable for
OPVC / UPVC / HDPE / PE
Piping Systems

Ductile Iron Fittings for OPVC/UPVC/HDPE or PE Piping System

Requirements and test methods

Scope

This European Standard specifies the requirements and associated test methods applicable to ductile iron fittings, ductile iron and mild steel couplings and flange adaptors and their joints to be used with poly (vinyl chloride) (PVC-U) pipes or polyethylene (PE) pipes

Standardized sizes

The standardized sizes of fittings, corresponding to the nominal outside diameter dn (in millimeters) of the pipes to which they shall be connected, are as follows : 63, 75, 90, 110, 125, 140, 160, 18, 200, 225, 250, 280, 315, 355, 400, 450, 500, 560, 630, 710.

Surface condition and repairs

Materials shall be free from defects and surface imperfections which could lead to non-compliance. Material characteristics

Ductile Iron

Tensile properties

Ductile iron fittings, couplings and flange adaptors shall have a minimum tensile strength of 420 Mpa and a minimum elongation after fracture of 5%. The tensile strength shall be tested in accordance.

Hardness

The Brinell hardness, shall not exceed 250 HBW. For components manufactured by welding, a higher Brinell hardness is allowed in the heat-affected zone of the weld.

Coatings

General All Materials shall be delivered with an external and internal epoxy coating in compliance with EN 14901. Alternatively, the coatings may also be supplied as required by the purchaser. (By agreement between the manufacturer and the purchaser, the lining/coating may be applied depending on the internal conditions of use)

Minimum Wall Thickness

dn	Min. Thickness, mm
$dn \leq 225$	4.0
$225 < dn \leq 315$	5.0
$315 < dn \leq 710$	6.0

Hydrostatic Works Test Pressures

When Hydrostatic test is carried out, it shall be with the min. test pressure 16 bar for DN 40 mm to 630 mm, and the total duration of the pressure cycle shall be not less than 15 s, including 10 s at test pressure (as per EN:12842)

Tolerance / Deviations

The tolerance of fittings shall be as follows BS EN 12842

Note : Unless otherwise agreed between the purchaser and the manufacturer the requirement of sleeving shall comply with the requirements.

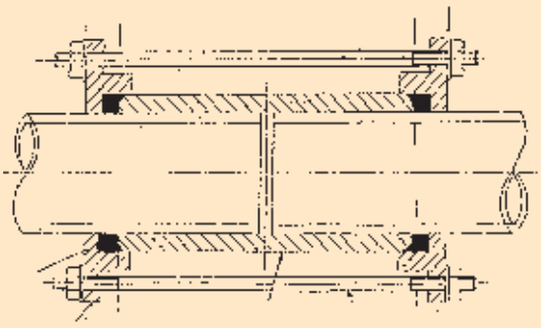
NOTE :

1. Puddle Flange will be 10mm thick upto 300 mm dia, 15 mm from 350 to 600 mm & 20 mm from 700 to 1800 mm dia, unless otherwise specified
2. Pipes can be supplied with Flanged ends, Plain ends, Flange Spigot ends and with puddles flanges in all combination and in all length with max limit being 2.0 mtrs.

*All dimensions are in millimetres.

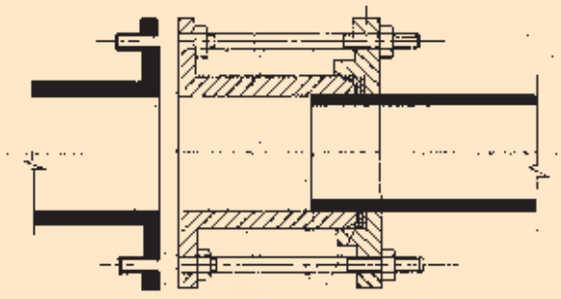
Mechanical Coupling



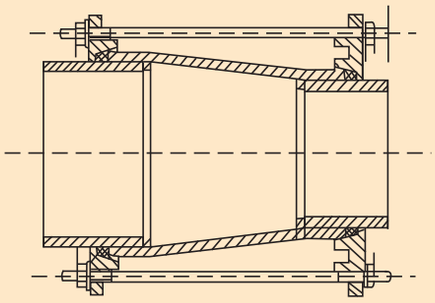
End Connection
To join two similar plain ends only.
Use
I) With CI & DI pipes
ii) can be manufactured specially to suit all other kinds of pipes such as AC, PVC, uPVC, MS, SS etc.
Working
Tightening of bolts draws the two flanges together compressing the sealing ring in the recess between sleeve and flanges on to the pipe thus effecting a leak tight joint.
Size 80mm to 1800mm NB.
Material Used Ductile Iron
Advantages
It can absorb limited expansion, contraction, ground movement and long radius curves and adjust gaps in pipelines.

Flanged Mechanical Adapters

End Connection
To join one plain end and other flanged end only.
Use
i) with CI & DI pipes
ii) can be manufactured specially to suit all other kinds of pipes such as AC, PVC, uPVC, MS, SS etc.
Working
Tightening of bolts draws compression flange towards spigot end of flanged barrel thereby compressing the sealing rubber ring in the recess between compression flange and the spigot **end of flange barrel** effecting a leak **tight joint.**
Size 80mm to 1800mm NB.
Material Used Ductile Iron
Advantages
It can absorb limited expansion, contraction, ground movement and long radius curves and adjust gaps in pipelines.



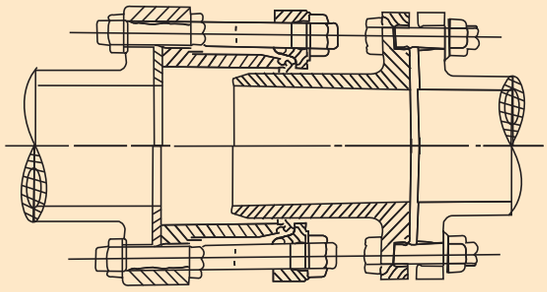
Reducing Mechanical Coupling



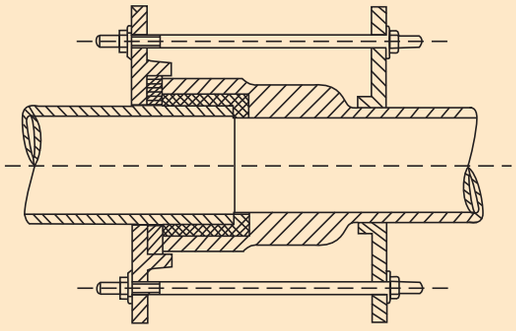
End Connection
To join two dis-similar plain ends having different outside diameters.
Use
with CI, DI, AC, PVC, uPVC, MS, S.S, etc virtually all kinds of rigid pipes.
Working
Tightening of bolts draws the two flanges together compressing the seal ring in the recess between sleeve and flanges on to the pipe thus effecting a leak tight joint.
Size 80mm to 1800mm NB.
Material Used Ductile Iron
Advantages
It can absorb limited expansion, contraction, ground movement and long radius curves.

Adjustable Dismantle Joints

End Connection
To join two flanged end.
Use
I) with all kinds of pipes but having flanged ends.
ii) can be manufactured specially to suit all other kinds of pipes such as AC, PVC, uPVC, MS, SS etc.
Working
A flanged spigot of same nominal bore as that of adjoining pipeline slides inside a flanged spigot barrel of higher diameter to create space in the pipeline upto a maximum of 0 to 100 mm.
Size 80mm to 1800mm NB.
Material Used Ductile Iron
Advantages
i) to create gaps/space in flanged pipeline.
Ii) to fill up/adjust gaps/space in flanged pipelines
iii) can absorb limited vibration/expansion contraction



Socket Leak Repair Joint Clamps



End Connection
To seal the leaking socket joints/ends of pipes having Tyton Rubber Ring Joints or lead caulked Joints.

Use
CI DI socket end pipes (Lead or Tyton Rubber Joints)

Working
Compression Ring, Clamp and Rubber rings are supplied in two parts to be joined with nut bolt and J-hook. The compression Ring is pulled towards socket thereby sealing the gap inbetween the socket and Compression Ring with the help of rubber ring on to the pipe.

Size 80mm to 1800mm
Material Used Ductile Iron

Advantages
Leaking socket ends on Running pipeline can be repaired by digging trenches only near the socket ends.

Expansion Bellow

End Connection
Double flanged end.

Working
Expansion bellows are flexible mechanical devices used in piping systems, ducts, and equipment to absorb dimensional changes caused by thermal expansion, contraction, vibration, or pressure fluctuations. They help maintain the integrity of the system by preventing damage to pipes, pumps, vessels, and other components.

Use for both CI & DI Pipes
Size 80mm to 1800mm
Material Used Ductile Iron

Advantages
Automatically absorbs expansion/contraction in pipeline thereby prolonging the lifespan of pipeline and reducing chances of bending / zig zag lines.

Saddle Pieces - Screwed End

End Connection
For branch connection of screwed end in small dia of 15 to 65 mm.

Use On C.I/D.I/M.S/U.P.V/P.V.C/A.C/S.S Pipe etc.

Working

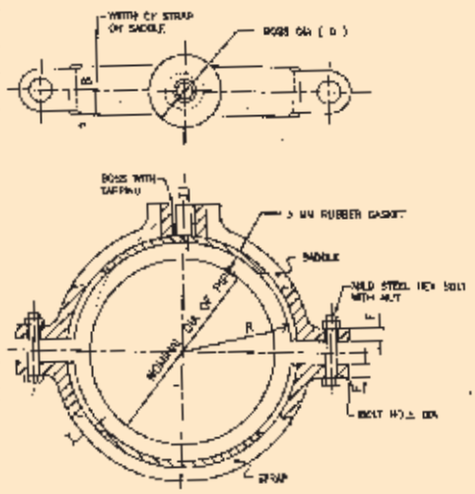
Saddle piece is supplied in two parts bolted together. The bottom half has rubber pad for support only. The top half has screwed outlet at the top. It's base has a round flat rubber gasket pasted with a hole drilled in the centre, to seal the opening. This top half sits on the drilled hole of equal diameter on main pipe. When the end flange nut bolts are tightened the pasted rubber pad tightens towards the main pipes barrel O.D. to seal the opening.

Size **Main Pipes** : 50 mm to 2000 mm dia
Outlet (Screwed) : 15 mm to 65 mm dia

Material Used Ductile Iron / M.S. Zinc metallised / Stainless Steel

Advantages

A threaded branch connection for fitting an air valve, pressure gauge, meters or branch pipe connection can be taken out from an existing, laid out pipe line without disturbing the main pipe line. A hole of required diameter is drilled by portable drill at site on the pipe & the Saddle piece simply sits on the hole & end nut bolts tightend.



Saddle Pieces - Flanged End

End Connection
For branch connection of flanged end in dia of 25 to 200 mm

Use On C.I/D.I/M.S/U.P.V.C/A.C/S.S Pipe etc.

Working

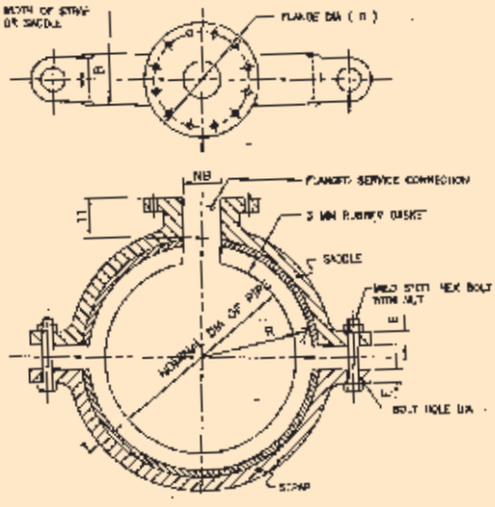
Saddle piece is supplied in two parts bolted together. The bottom half has rubber pad for support only. The top half has flanged outlet at the top. It's base has a round flat rubber gasket pasted with a hole drilled in the centre, to seal the opening. This top half sits on the drilled hole of equal diameter on main pipe. When the end flange nut bolts are tightened the pasted rubber pad tightens towards the main pipe barrel O.D to seal the opening.

Size **Main Pipes** : 50 mm to 2000 mm dia
Outlet (Flanged) : 25 mm to 200 mm dia

Material Used Ductile Iron/M.S. Zinc metallised/Stainless Steel.

Advantages

A flanged branch connection for fitting an air valve, pressure gauge,meters or branch pipe connection can be taken out from an existing, laid out pipe line without disturbing the main pipe line. A hole of required diameter is drilled by portable drill at site on the pipe & the Saddle piece simply sits on the hole & end nut bolts tightened.



Telescopic Surface Box

Working
Telescopic surface box is a type of access box used in water supply, gas, drainage, and utility networks to provide easy access to underground valves, hydrants, or other fittings while allowing for ground-level adjustments. It is designed in a telescoping (sliding) arrangement, meaning its height can be adjusted on-site to match the final ground surface level.

Size 100 mm dia to 200 mm dia

Material Used Ductile Iron

Wide Tollerance Coupling

End Connection
To join two various type of plain ends pipes

Use
with CI, DI, AC, PVC, uPVC, MS, S.S, etc
virtually all kinds of rigid pipes.

Working
A wide tolerance coupling is a flexible mechanical sleeve or joint that can accommodate pipes made of different materials (such as ductile iron, steel, PVC, asbestos cement, GRP, etc.) and different outside diameters, while still ensuring a leak-tight and pressure-resistant connection.

Size 80mm to 400mm NB.

Material Used Ductile Iron

Advantages
It can absorb limited expansion, contraction, ground movement and long radius curves.

Pipe Body Patch Clamp

End Connection
To seal small leakages / cracks on pipe body.

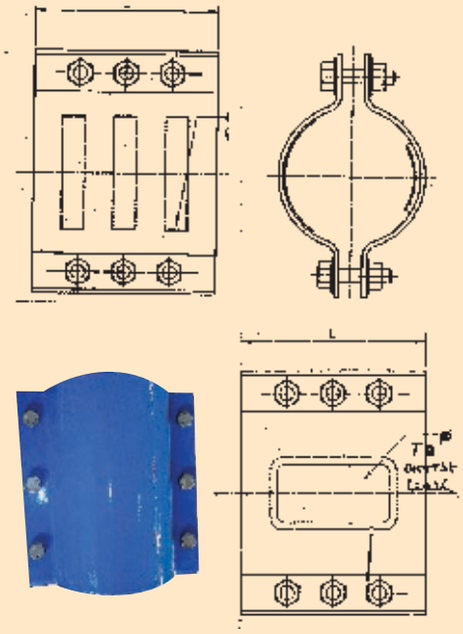
Use
CI /DI/MS/AC/PVC/UPVC/SS etc. i.e. Virtually all kinds of Rigid Pipes.

Working
The patch clamp consists of two halves. One half contains three straight patches of rubber for support. The other half contains a rubber pad with a recessed centre to cover the pipe body crack/leak. Tightening the end flange nut bolt tightens the rubber pad on to the crack/leak portion thereby sealing the leak.

Size 50 mm dia to 2000 mm dia

Material Used Ductile Iron / M.S / S.S

Advantages
Can be used to seal small longitudinal/circumferential cracks/leakages on a running/in use pipeline to arrest leak.



Quick Flange Adapter

End Connection
To join one plain end and other flanged end only.

Use
To join UPVC, OPVC, HDPE, PE Pipes etc.

Working
A Quick Flange Adapter (QFA) is a mechanical fitting used in piping systems to quickly connect plain-end (spigot) pipes to flanged equipment, valves, or fittings without the need for complex welding or threading.It's commonly used in water supply, sewage, and industrial pipelines for fast and secure installation.

Size 80mm to 600mm NB.

Material Used Ductile Iron

Advantages
It can absorb limited expansion, contraction, ground movement and long radius curves and adjust gaps in pipelines.

1200	1255	20.4
1400	1462	22.8
1500	1565	24.0
1600	1668	25.2
1800	1875	27.6
2000	2082	30.0
2200	2288	32.4
2400	2458	34.8
2600	2684	37.2

*All dimensions are in millimetres.

Jointing

Jointing procedures will vary according to the type of joint being used. Basic conditions which should be ensured for all types of joints are:

- Cleanliness of all parts
- Correct location of components
- Centralization of spigot within socket
- Strict compliance with jointing instructions

Jointing Methods

- Centre the spigot in the socket and keep it in this position.
- Push the spigot into the socket, checking alignment and level.
- Deflect, if required, within the permissible limits.
- Push in the spigot until the mark is in line with the socket face. Do not go beyond this position.
- The assembly of DI push-on joint pipes and connections is easily performed using some standard equipment such as crowbars, TIRFOR type winches or the bucket of a mechanical excavator.

CROWBAR METHOD (for DN 80 to 150) The crowbar levers against the ground. The pipe socket face must be protected with a piece of hard wood. The jointing done by the leverage of the crowbar.	EXCAVATOR BUCKET (for all Diameter) The hydraulic force of the arm of a mechanical excavator can be effectively used to assemble pipes and straight fittings. However the following precautions are to be taken: • Between the socket and excavator bucket, place a wooden batten as a cushion • Exert a slow and steady force observing the rules for joint assembly	TIRFOR type mechanical winches or chain pulley: • **DN 150 to 300:** TIRFOR type winch, capacity 1.6 Tons, steel cable and rubber protected hooks • **DN 350 to 400:** TIRFOR type winch, capacity 3.5 Tons, steel cable and rubber protected hooks	
#Any of the above methods as found suitable can be used

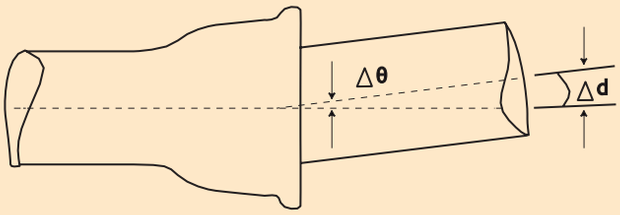
Push-on Jointing Method for DI Pipes

End Preparation for Jointing

Where Push-on joints are to be used, the cut ends should be chamfered by filing or grinding similar to the original spigot ends.

For DN 300 and above sizes, where the pipes are to be checked and ascertained as being suitable for cutting i.e. the pipe OD should be within the ovality tolerances as specified in the relevant standard.

Permissible Deflection after Laying



Δθ = Deflection, Δd=Deviation, for Push-on Joint and Mechanical Joint
Allowable Deflection has been given in Table 2.10.4

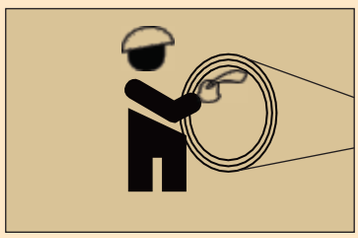
Lubrication

A layer of lubrication should be applied on the exposed surface of the gasket, and the spigot end. The lubricating paste to be brush applied. No petroleum base lubricant should be used.

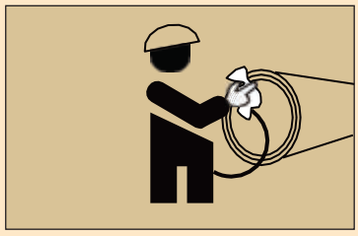
Jointing of Push-on Joint

A. Procedure for Insertion of Rubber Gasket for Push-on Joint

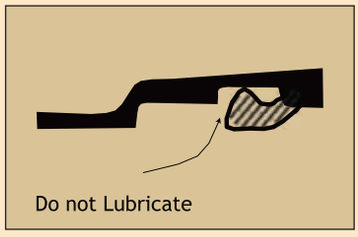
- Clean the inside of socket groove where gasket heel is to be inserted using a wire brush and a rag.



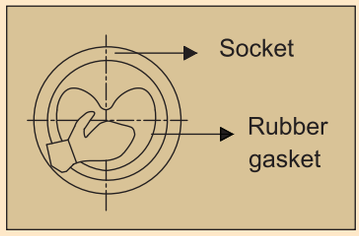
- Clean gasket and insert to socket with the square section gasket heel in the retaining groove.



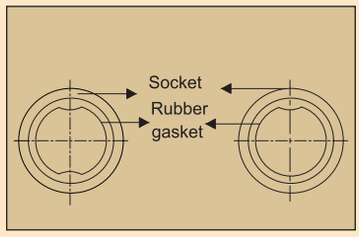
- Coat with lubrication paste on the spigot end of the pipe and the exposed surface of the gasket



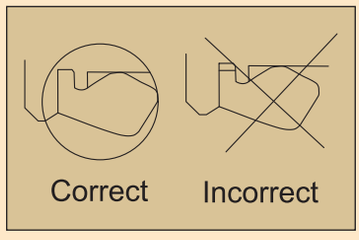
- The insertion of DN 80 to DN 150 gaskets is facilitated by turning the gasket inside out, gripping one end and folding the free end down (to make Heart shape) as shown below:



- The insertion of DN 200 and larger gaskets is facilitated by folding the gasket as shown by looping it into a heart shape with the gasket bulb towards the back of the socket. For DN 800 - DN 1600 it is preferable to loop the gasket into shape of a cross for insertion.

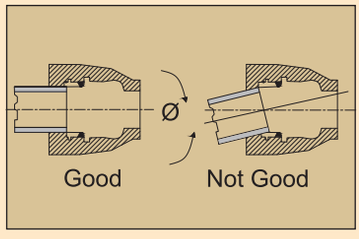


- After insertion of the gasket, confirm that the Heel position is properly seated in socket groove.



B. Insertion Depth of Socket

- The insertion depth of the spigot is indicated by two parallel lines at the outside of spigot end as shown in figure 5.5.2. The pipe spigot should be inserted in the socket in aligned condition as shown in fig below. The deflection in the pipe should be provided (within the allowable limit) after the insertion.



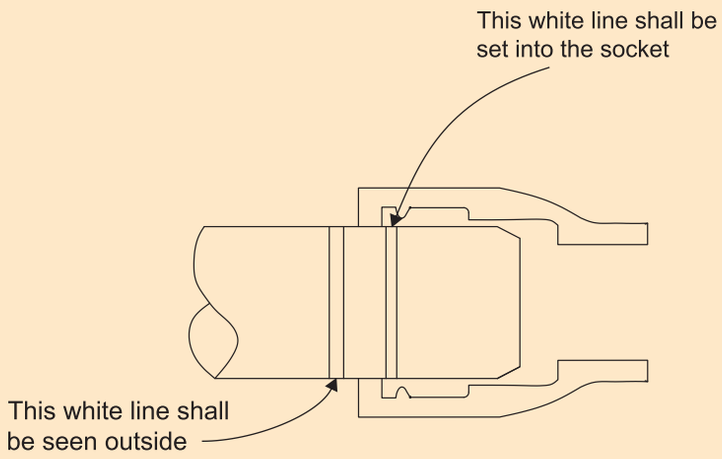
Insertion Depth for Socketed Joints

DN	Insertion Depth for TJ pipe		Insertion Depth for AJ pipe	
	Minimum	Maximum	Minimum	Maximum
80	65	73	72	80
100	68	76	74	82
125	70	78	77	85
150	74	82	80	88
200	80	88	86	94
250	85	93	86	94
300	90	98	87	95
350	90	98	90	98
400	90	103	92	100

*All dimensions are in millimetres.

C. Joint Correction

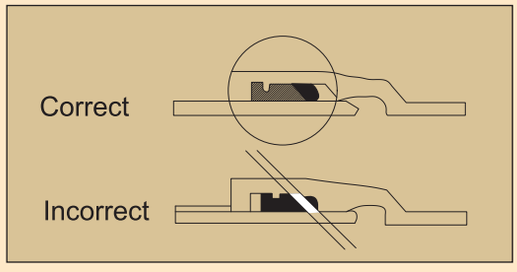
- Ensure that gasket is located correctly around its whole circumference with its groove on the retaining bead in the socket and retaining heel firmly bedded in its seat. At time of insertion of the spigot end check alignment of the pipes and fittings.
- Ensure that the gasket is correctly in position by inserting the end of a metal under (130mm to 200mm length) through the annular spigot and socket gap until it touches the gasket. The ruler must penetrate to the same depth around the whole circumference. If a difference is found, the gasket may have been displaced and the join should be dismantled and attempted again.



Figures Showing Push-on Jointing Procedures for DI Pipes

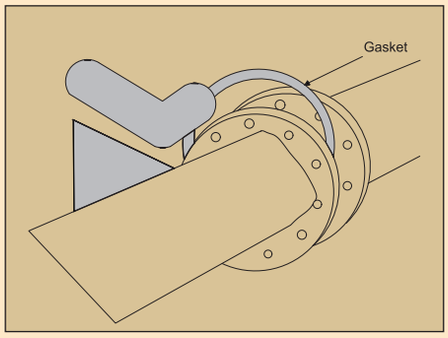
D. Joint Dismantling

- Socketed joints can usually be separated by using lifting equipment appropriate to the size of the pipe. Secure a webbing sling, of suitable size and strength, around the pipe near the end farthest from the joint to be dismantled. Then attach to the lifting equipment and raise and lower the pipe, within the specified deflection limitations, whilst at the same time exerting slight pulling force, so that the spigot is 'walked' out of the socket.



Procedure for Jointing of Flanged Fittings

Flanged joints are both rigid and self anchoring, and are primarily used in above ground installations. To ensure a proper jointing, it is imperative to align the faces of the flanged ends in a straight line.



Manual Bolt Tightening Procedure

a) Ensure that the flanges are parallel and axially aligned.

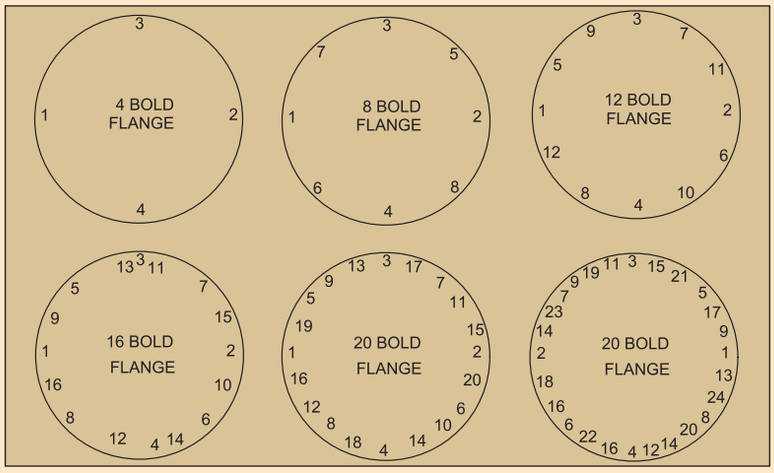
b) Lubricate the nut and bolt threads, and the contact face of the nut on the flange.

c) Locate the gasket and lightly nip the bolts.

d) Tighten evenly to approximately one third of the final torque following the sequence shown in Bolt Tightening Sequence below.

e) Repeat the tightening sequence in at least three more steps to the full torque. If required by the procedure, use a torque wrench.

f) Finally re-tighten adjacent bolts, start and finish at the same bolt, e.g. 1, 3, 2, 4 and 1. Use a torque wrench if required.



Figures Showing Manual Bolt Tightening Procedure

Bolting Torques Required for Tightening of Flanged Joints

Procedure for Assembly System Ductile Iron Pipe of Kejriwal Mechanical Restrained Joint

1. Before assembling, make sure that the coupling faces of the ring and the gland are clean, then position the gland and the locking ring on the spigot end of the pipe.
2. Keep sufficient space beneath the socket in order to tighten the bolts with the torque wrench during the installation of MR joint accessories.
3. The locking ring should be fitted on the spigot end of the pipe to be jointed and passed over the weld bead. The ring has to adhere solidly to the pipe and its flat side should be adjacent to the weld bead.
4. During installation make sure that the components to be assembled are aligned.
5. When the joint has been assembled, check again to ensure the correct position of the ring and its adherence to the pipe near the weld bead, then fix the gland to the socket using the locking bolts.
6. Make sure the gland and pipe are coaxial, using centring spacers if necessary, and make sure that the moment between the pipe and gland is constant when the pipes are aligned.
7. Once the MRJ gland has been positioned correctly, fit and tighten the bolts in crossed sequence, using a torque wrench to tighten to the correct torque.
8. After hydraulic testing, it is highly recommended that the tightness of the bolts are checked with the torque wrench, and further tightened if necessary.

Procedure for Assembly Ductile Iron Pipe of Kejriwal Restrained Joint System

1. Keep the lock insertion grooves/opening on the top side to facilitate the easy insertion of locks.
2. Before assembling, make sure that all the chambers of the Double chamber sockets are thoroughly clean.
3. Install the gasket in the innermost chamber of the socket as per the procedure explained earlier in the catalogue for push-on joint.
4. Clean the spigot end of pipe with weld bead using a soft brush thoroughly removing all the dust, foreign particles, excess paints etc.
5. Apply a thin layer of lubricant on the spigot end of pipe particularly near the bevel end of the pipe.
6. The spigot end with weld bead is pushed in the socket using suitable tools depending upon the pipe size. Care should be taken to keep the pipe at perfect aligned condition without having any angular deflection.
7. The lock segments should be inserted one by one through the window provided in the socket face and distributed along the pipe circumference of the pipe working alternatively left and right.
8. After inserting the last lock, all the locks should be clamped using a strap. The clamping strap should be tightened until the locking segments are bearing firmly against the pipe surface all around.
